

IN THE CLAIMS:

Claim 1 (original): A sensor for determining flow rate of a fluid through a volume, comprising:

a thermistor at least partially inserted into the volume; and

a sensor circuit adapted to cycle the thermistor between a zero-power mode and a self-heated mode.

Claim 2 (original): The sensor as recited in claim 1, wherein the sensor circuit comprises a configurable power controller adapted to cycle the thermistor between a zero-power mode and a self-heated mode.

Claim 3 (original): The sensor as recited in claim 2, wherein the configurable power controller comprises:

a variable resistance; and

a switch in association with the variable resistance, the switch being adapted to cycle the variable resistance between a first value and a second value, the first value being selected to operate the thermistor in the zero-power mode and the second value being selected to operate the thermistor in the self-heated mode.

Claim 4 (original): The sensor as recited in claim 3, wherein the thermistor is in series with the variable resistance between a first side of a power source and a second side of a power source.

Claim 5 (original): The sensor as recited in claim 4, wherein the thermistor is arranged in series with the variable resistance at the high side of the power source.

Claim 6 (original): The sensor as recited in claim 4, wherein the thermistor is arranged in series with the variable resistance at the low side of the power source.

Claim 7 (original): The sensor as recited in claim 1, further comprising a conversion circuit for use in measuring the voltage drop across the thermistor.

Claim 8 (original): The sensor as recited in claim 7 6, wherein the conversion circuit comprises a first channel for measuring the voltage drop across the thermistor when the thermistor is in its zero-power mode and a second channel for measuring the voltage drop across the thermistor when the thermistor is in its self-heated mode.

Claim 9 (currently amended): The sensor as recited in claim 8 7, wherein each ~~the~~ channel comprises an isolation amplifier.

Claim 10 (currently amended): The sensor as recited in claim 8 7, wherein the second channel comprises a voltage divider for scaling down the voltage drop across the thermistor.

Claim 11 (original): The sensor as recited in claim 6, wherein the conversion circuit is adapted to convert the voltage drop across the thermistor from logarithmic scale.

Claim 12 (original): The sensor as recited in claim 6, wherein the conversion circuit comprises a micro-controller adapted to convert the voltage drop across the thermistor in the zero-power mode and the voltage drop across the thermistor in the self-heated mode to the flow rate of the fluid through the volume.

Claim 13 (original): The sensor as recited in claim 3, wherein:

the variable resistance comprises a first fixed resistor in series with a second fixed resistor; and

the switch comprises a transistor in parallel with the first fixed resistor such that the transistor is operable to bypass the first fixed resistor.

Claim 14 (original): The sensor as recited in claim 2, wherein the configurable power controller comprises a configurable constant current source adapted to cycle the thermistor between a zero-power mode and a self-heated mode.

Claim 15 (original): The sensor as recited in claim 1, wherein the sensor circuit further comprises a reference circuit adapted to store a zero-power voltage as a reference value.

Claim 16 (original): The sensor as recited in claim 15, wherein in the self-heated mode a known pulse of heat is injected into the thermistor for a predetermined period of time.

Claim 17 (original): The sensor as recited in claim 16, wherein the sensor circuit further comprises a comparison circuit that compares the stored reference value with a changing zero-power voltage value associated with the dissipation of the injected known pulse of heat into the flowing fluid.

Claim 18 (original): The sensor as recited in claim 17, wherein the sensor circuit further comprises a timer circuit that measures the time required for the stored reference value to substantially equal the changing zero-power value associated with the dissipating injected pulse of heat.

Claim 19 (original): The sensor as recited in claim 18, wherein the sensor circuit further comprises an offset circuit that adds an offset voltage value to the stored reference value thereby accommodating for variations in the ambient temperature of the flowing fluid.

Claim 20 (original): The sensor as recited in claim 18, further comprising a conversion circuit adapted to convert the stored reference value, the time required to dissipate the known injected pulse of heat into the flowing fluid, and thermal properties of the fluid to the flow rate of the fluid through the volume.

Claim 21 (original): The sensor as recited in claim 2, wherein the configurable power controller comprises a configurable constant voltage source adapted to cycle the thermistor between a zero-power mode and a self-heated mode.

Claim 22 (original): A method of measuring a flow rate of a fluid flowing through a volume, comprising:

- setting a thermistor to operate in a zero-power mode;

- determining the ambient temperature of the fluid;

- setting the thermistor to operate in a self-heated mode;

- supplying a known amount of energy to the fluid;

- determining the amount of heat absorbed by the fluid; and

- determining the flow rate of the fluid utilizing the ambient temperature of the fluid, the amount of heat absorbed by the fluid, and thermal properties of the fluid.

Claim 23 (original): The method as recited in claim 22, wherein determining the ambient temperature of the fluid, comprises:

- measuring the zero-power voltage of thermistor;

- converting the zero-power voltage to a resistance value; and

- converting the resistance value to a temperature value.

Claim 24 (original): The method as recited in claim 22, wherein determining the self-heated temperature of the thermistor, comprises:

- measuring the self-heated voltage of thermistor;
- converting the self-heated voltage to a resistance value; and
- converting the resistance value to a temperature value.

Claim 25 (original): A method of measuring a flow rate of a fluid flowing through a volume, comprising:

- setting a thermistor to operate in a self-heated mode;
- supplying a known amount of energy to the fluid;
- determining the amount of heat absorbed by the fluid;
- setting the thermistor to operate in a zero-power mode;
- determining the ambient temperature of the fluid; and
- determining the flow rate of the fluid utilizing the ambient temperature of the fluid, the amount of heat absorbed by the fluid, and thermal properties of the fluid.

Claim 26 (original): The method as recited in claim 25, wherein determining the ambient temperature of the fluid, comprises:

- measuring the zero-power voltage of thermistor;
- converting the zero-power voltage to a resistance value; and
- converting the resistance value to a temperature value.

Claim 27 (original): The method as recited in claim 25, wherein determining the self-heated temperature of the thermistor, comprises:

- measuring the self-heated voltage of thermistor;
- converting the self-heated voltage to a resistance value; and
- converting the resistance value to a temperature value.

Claim 28 (original): A method of measuring a flow rate of a fluid flowing through a volume, comprising:

setting a thermistor to operate in a zero-power mode;

storing a resultant zero-power voltage as a reference value;

setting the thermistor to operate in a self-heated mode for a predetermined period of time thereby injecting a known pulse of heat into the thermistor;

setting the thermistor to operate in a zero-power mode thereby allowing the injected known pulse of heat to dissipate into the flowing fluid;

comparing the stored reference value with a changing zero-power voltage value associated with the dissipating injected pulse of heat;

measuring the time required for the stored reference value to substantially equal the

changing zero-power value associated with the dissipating injected pulse of heat;

determining the ambient temperature of the fluid utilizing the stored reference value; and

determining the flow rate of the fluid utilizing the ambient temperature of the fluid, the time required to dissipate the known injected pulse of heat into the flowing fluid, and thermal properties of the fluid.

Claim 29 (original): The method as recited in claim 28, further comprising adding an offset voltage value to the stored reference value thereby accommodating for variations in the ambient temperature of the flowing fluid.

Claim 30 (original): The method as recited in claim 28, wherein determining the ambient temperature of the fluid utilizing the stored reference value, comprises:

measuring the zero-power voltage of thermistor;

converting the zero-power voltage to a resistance value; and

converting the resistance value to a temperature value.
